

PRACTICAL AIRPORT PAVEMENT M&R MANAGEMENT

Y. Hachiya & M. Kanno
Service Center of Port Engineering
Tokyo, JAPAN

1

Contents

- ✈ Performance of Airport Pavements
 - Structure
 - Safety
 - Surface Course Durability
- ✈ APMS (M&R) in Japan
 - Inspection & Maintenance
 - Evaluation
 - Rehabilitation

2

Airports in Japan

- International hub : 4
- Major local: 24
- Local : 54
- Civil/military : 7
- Other : 9

3

PERFORMANCE OF AIRPORT PAVEMENTS

4

Required Performance

- ✈ Structure
 - Subgrade & Bases (Bearing Capacity & Frost), HMA - Fatigue & Rutting
- ✈ Safety
 - Rutting, Surface Friction
- ✈ Surface Course Durability
 - Aging, Raveling, Debonding between Layers

5

Structure

- ✈ Performance-Based Design - Verification

- ex: Fatigue Cracking in HMA

$$\gamma_i \cdot FD_d / FD_{dl} \leq 1.0$$

- FD_d : Design Value of Fatigue Damage
- FD_{dl} : Limit Value of FDD
- γ_i : Importance Factor

$$FD = \sum_{i=1}^m \frac{n_i}{N_{fi}}$$

6

Safety

- ✈ Surface Friction
 - Coefficients of friction are periodically inspected

Grooving		Tire pressure
w	w/o	
0.55	0.45	Low
0.45	0.4	High

by Surface Friction Tester

- Grooving is generally required

- ✈ Surface Configuration
 - Follows the ICAO Recommendations

7

Surface Course Durability

- ✈ Debonding between Layers
 - Materials are specified as follows;
 - Increase Aggregate Size
 - Use Polymer-Modified Asphalt
 - Secure Air Void 3% or more
 - Increase Single Lift Thickness to 80mm
 - Use Warm Mix Asphalt if necessary

8

AIRPORT PAVEMENT M&R MANAGEMENT SYSTEM IN JAPAN

9

Airport Pavement M&R Management

10

INSPECTION AND MAINTENANCE PHASE

Pavement Inspection

- Patrol
 - Visually, on foot or slow-moving vehicle
- Emergent
 - Visually, after earthquake
- Detailed
 - When necessary, surface distress by measuring vehicle & structure by FWD, etc.
- Periodic
 - Surface distress and configuration

11

New Inspection Patrol System

- Mobile PC & Differential GPS
- Process
 - Identification
 - Evaluation and treatment
 - Description and photographing
 - Reporting

12

Surface Distress

- PRI (Pavement Rehabilitation Index)
 - $PRI = 10 - 0.450CR - 0.0511RD - 0.655SV$
 - CR: Crack Ratio, RD: Rut Depth, SV: Roughness

- The need for rehabilitation works

- A: unnecessary
- B: in the near future (sub-classified into 3 cat.)
- C: immediately

Facility	A	B	C
Runway	8.0 <	3.8 – 8.0	< 3.8
Taxiway	6.9 <	3.0 - 6.9	< 3.0
Apron	5.9 <	0.0 - 5.9	< 0.0

13

Structural Evaluation with FWD

14

Overlay Design

- Existing Pavement Evaluation
 - Experienced traffic volume, components & properties of existing pavement
- Design Conditions
 - Design period, loading conditions, climate, fatigue properties of new HMA
- Fatigue Analysis
 - Strains of HMA, aircraft wandering
- Overlay Thickness Design

15

Design Example

- Fatigue Damage (FD) of Existing HMA Bottom Layer
- Accumulated till the Present: 0.8
- Added after Overlay: 0.204 – 0.142
- Summed: 1.004 - 0.942
- Overlay Thickness: 80mm

Overlay Thickness (mm)	Accumulated FD	Added FD	Summed FD	Judgment
70	0.8	0.204	1.004	NG
80	0.8	0.171	0.971	OK
90	0.8	0.142	0.942	OK

16

Rehab Work Scheduling

- ✈ AirPORTS (Airport Pavement Optimal Rehabilitation Timing System)

Database

Annual change of PRI
Recovery of PRI due to rehabilitation works
Cost of rehabilitation work

Optimal Rehabilitation Procedure Selection

Acceptable PRI

Rehabilitation Cost Prediction

Annual rehabilitation cost for service duration

Rehabilitation Budget Allocation
